Education

Adamson University — Manila, Philippines
Bachelor of Science in Computer Science and Information Engineering — *Aug. 2024 – Present*
Relevant Coursework: Application Development, Introduction to Computing, OOP, AI, DSA

Technical Skills

Languages: JavaScript, HTML/CSS, SQL
Frameworks & Runtimes: Node.js, Express.js, Bootstrap, Electron
Databases: MongoDB
Developer Tools: Git, GitHub, Vercel, VS Code

Experiences

Barangay Information Management System | *C#, SQLite, Electron.js, JavaScript* — Mar 2026 – May 2026

- Developed frontend features and UI components for a desktop-based Barangay Information Management System using Electron, HTML/CSS, and JavaScript.
- Collaborated with team members on database structure, API integration, and workflow organization.
- Assisted in technical documentation and repository organization to support team coordination and development.
- Participated in testing, debugging, and feature integration throughout the project lifecycle.

Projects

Waste-Classifying AI Model | *Python, TensorFlow Keras*

- Developed an image classification model using transfer learning with MobileNetV2 to categorize garbage into recyclable and non-recyclable classes.
- Achieved a validation accuracy of approximately 94% on a dataset of over 19,000 images, demonstrating strong predictive performance.
- Implemented robust training practices including data augmentation, early stopping, and model checkpointing for improved generalization and persistence.

Personal Blog Website | *JavaScript, Node.js, Express.js, MongoDB, HTML/CSS*

- Built a responsive full-stack blog application using Node.js, Express, and MongoDB.
- Implemented server-side rendered routes for displaying posts, with MongoDB as the storage solution for blog content.

Code Everyday Repo | *JavaScript, Node.js, Express.js, HTML/CSS, Git*

- Personal daily mini-project repo demonstrating front-end fundamentals: DOM manipulation, event handling, responsive layouts, web components, and SPA routing.
- Built interactive apps and integrations including Fetch/REST API clients (JokeAPI), dynamic UI components, a keyboard-event simulator, and a Notes app with localStorage persistence.
- Practiced backend routing with Node.js and Express, with iterative refactoring and debugging to improve code quality across multiple project versions.

Learn.js | *JavaScript, HTML/CSS*

- Developed a JSON-driven single-page learning platform that dynamically loads and renders lessons via the Fetch API and modular vanilla JavaScript.
- Implemented interactive learning features including syntax-highlighted code blocks (Prism.js), copy-to-clipboard, inline code, quizzes, and a live playground.
- Produced supporting documentation and design artifacts (flowchart, evaluation sheet) and built a responsive UI with hamburger nav and lesson menu.
